RETENCIÓN DE PRODUCTOS DE LA CONCEPCIÓN: WAIT AND SEE!

Marina Soto Sogorb MIR 4

Alba Soriano Soler MIR 4

Servicio de Obstetricia y Ginecología.

CASO CLÍNICO

Mujer de 33 años gestante de 22+3 semanas que consulta por sensación de pérdida de líquido. No otra clínica.

ANTECEDENTES

No antecedentes médico-quirúrgicos de interés.

FO: 1.0.0

<u>Gestación actual:</u> Controlada y normoevolutiva

CASO CLÍNICO

EXPLORACIÓN
Afebril
Espéculo: paredes vaginales brillantes.
Test de detección temprana de RPM (AmniSure®) : positivo
TV: cérvix cerrado y formado
ECOTV: cervicometría de 30 mm
ECOAB: feto en podálica, LC+, MF+, ILA 2-3, placenta fúndica lateral izquierda. PFE: 470g

ANALÍTICA
Leucocitos 13470 mm^3 (N 75.3%) ; PCR 0.6 mg/dl ; resto normal.

CASO CLÍNICO

EVOLUCIÓN

- Ingreso: control clínico-analítico-ecográfico.
  Cultivos EC, CV, EGB y urocultivo.

- 3er día de ingreso: 22+6 SG, empeoramiento clínico-analítico ↑RFA/ Tª

  →**Sx corioamnionitis:** finalizar gestación

  Tto con prostaglandinas vaginales. Se produce expulsión fetal: 520g Apgar 0/0.

Retención de placenta

- Qx: alumbramiento manual
  Extracción de placenta muy dificultosa.
  Persistencia de restos → legrado ecoguiado
  TV: septo uterino.

  ↳ **Útero contraído**
  Sangrado fisiológico

CASO CLÍNICO

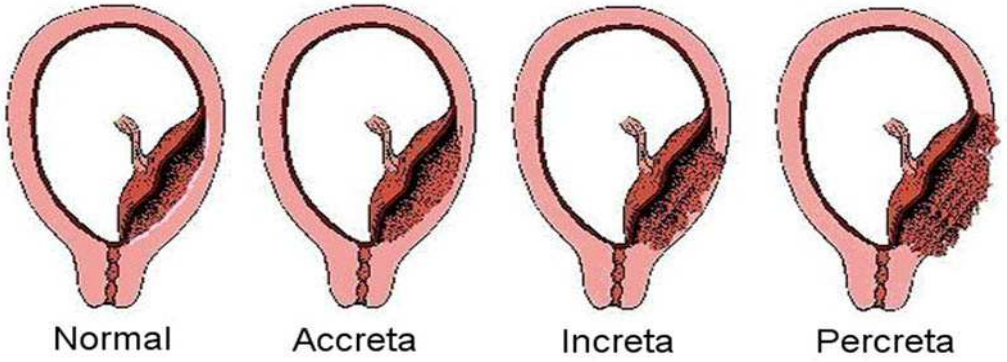
Sx: **espectro de placenta ácreta (PAS)**

- ✓ **Paciente hemodinámicamente estable**
- ✓ **Control estrecho y estudio del caso.**

RETENCIÓN DE PRODUCTOS DE LA CONCEPCIÓN

Espectro de placenta ácreta o acretismo placentario (PAS):

Inserción anormal de las vellosidades coriales directamente en el miometrio



Ácreta (81.6%): vellosidades se insertan directamente en el miometrio.

Íncreta (11.8%): vellosidades penetran hasta el interior del miometrio.

Pércreta (6.6%): vellosidades alcanzan la serosa peritoneal o incluso penetran en la cavidad abdominal e invaden órganos vecinos.

RETENCIÓN DE PRODUCTOS DE LA CONCEPCIÓN

ETIOPATOGENIA

Defecto decidualización
Área de cicatrización por Cx uterina previa

80%
HP cesárea/legrado /miomectomía

Alteración interfase endometrio-miometrio

Adherencia de vellosidades directamente/ invasión miometrio

¿ % ?

Ciertas patologías uterinas: malformaciones, adenomiosis, miomas submucosos… pueden asociarse a defectos endometriales microscópicos que permiten la invasión placentaria anormal.

Table 1 Unified descriptors, as suggested by the European Working Group on Abnormally Invasive Placenta (EW-AIP), for ultrasound (U findings in AIP

US finding	*EW-AIP suggested standardized definition*
2D grayscale	
Loss of 'clear zone' (Figure 1)	Loss, or irregularity, of hypoechoic plane in myometrium underneath placental bed ('clear zone')
Abnormal placental lacunae (Figure 2)	Presence of numerous lacunae including some that are large and irregular (Finberg Grade 3), often containing turbulent flow visible on grayscale imaging
Bladder wall interruption (Figure 3)	Loss or interruption of bright bladder wall (hyperechoic band or 'line' between uteri serosa and bladder lumen)
Myometrial thinning (Figure 4)	Thinning of myometrium overlying placenta to < 1 mm or undetectable
Placental bulge (Figure 5)	Deviation of uterine serosa away from expected plane, caused by abnormal bulge of placental tissue into neighboring organ, typically bladder; uterine serosa appears intact but outline shape is distorted
Focal exophytic mass (Figure 6)	Placental tissue seen breaking through uterine serosa and extending beyond it; most often seen inside filled urinary bladder
2D color Doppler	
Uterovesical hypervascularity (Figure 7)	Striking amount of color Doppler signal seen between myometrium and posterior wall of bladder; this sign probably indicates numerous, closely packed, tortuous vessels in that region (demonstrating multidirectional flow and aliasing artifact)
Subplacental hypervascularity (Figure 8)	Striking amount of color Doppler signal seen in placental bed; this sign probably indicates numerous, closely packed, tortuous vessels in that region (demonstrating multidirectional flow and aliasing artifact)
Bridging vessels (Figure 9)	Vessels appearing to extend from placenta, across myometrium and beyond serosa into bladder or other organs; often running perpendicular to myometrium
Placental lacunae feeder vessels (Figure 10)	Vessels with high-velocity blood flow leading from myometrium into placental lacunae, causing turbulence upon entry
3D ultrasound ± power Doppler	
Intraplacental hypervascularity (Figure 11)	Complex, irregular arrangement of numerous placental vessels, exhibiting tortuous courses and varying calibers
Placental bulge	(as in 2D)
Focal exophytic mass	(as in 2D)
Uterovesical hypervascularity	(as in 2D)
Bridging vessels	(as in 2D)

TABLE 1
Recommendations Regarding Management of Placenta Accreta Spectrum

Recommendation	Grade of Recommendation
Diagnosis of Placenta Accreta Spectrum	
Although ultrasound evaluation is important, the absence of ultrasound findings does not preclude a diagnosis of PAS; thus, clinical risk factors remain equally important as predictors of PAS by ultrasound findings.	1A Strong recommendation, high-quality evidence
It is unclear whether MRI improves diagnosis of PAS beyond that achieved with ultrasonography alone. Accordingly, MRI is not the preferred recommended modality for the initial evaluation of possible PAS.	1B Strong recommendation, moderate-quality evidence
Women with suspected PAS diagnosed in the antenatal period based on imaging or by clinical acumen should be delivered at a level III or IV center with considerable experience whenever possible to improve outcomes.	1B Strong recommendation, moderate-quality evidence

Hallazgos:
- Protusión uterina en vejiga.
- Intensidad heterogénea dentro de placenta.
- Bandas intraplacentarias en imagen T2-W.
- Vascularización anormal.
- Interrupción focal de miometrio.

Management	
Optimal management involves a standardized approach with a comprehensive multidisciplinary care team accustomed to management of PAS.	1B Strong recommendation, moderate-quality evidence
Delivery at 34 0/7–35 6/7 weeks of gestation is suggested as the preferred gestational age for scheduled cesarean delivery or hysterectomy absent extenuating circumstances in a stable patient. Earlier delivery may be required in cases of persistent bleeding, preeclampsia, labor, rupture of membranes, fetal compromise, or developing maternal comorbidities.	1A Strong recommendation, high-quality evidence
In the setting of hemorrhage, data from other surgical disciplines support the use of a range of 1:1:1 to 1:2:4 strategy of packed red blood cells: fresh frozen plasma: platelets.	1A Strong recommendation, high-quality evidence
Conservative management or expectant management should be considered only for carefully selected cases of PAS after detailed counseling about the risks, uncertain benefits, and efficacy and should be considered investigational.	2C Weak recommendation, low-quality evidence

Abbreviations: *MRI*, magnetic resonance imaging; *PAS*, placenta accreta spectrum.

CASO CLÍNICO

Control post-Qx:

Un año después… **mujer de 34 años con útero.**

Nueva gestación… lamentablemente aborto espontáneo a las 7 SG.

Próxima gestación **ALERTA** con signos ecográficos de **PAS.**

RETENCIÓN DE PRODUCTOS DE LA CONCEPCIÓN

CONCLUSIONES

- Ante paciente con cirugía uterina previa, es importante sospechar acretismo placentario. Alerta por aumento de su incidencia.
- Aunque lo ideal es realizar diagnóstico anteparto, la mayoría se realiza intraparto.
- El *gold standard* para el diagnóstico es la ecografía. La RMN es útil como prueba complementaria para valorar infiltración e invasión.
- El manejo debe llevarse en un hospital de tercer nivel con equipo multidisciplinar.
- El tratamiento es la cesárea e histerectomía.
- **En mujeres estables hemodinámicamente y con deseo genésico no cumplido se puede realizar tratamiento conservador histeroscópico. Convencer a la paciente, familia y equipo médico que la mejor actitud es esperar es el mayor reto en estos casos.**
